

1           **ABSTRACT OF THE DISCLOSURE**

2           A hinge for a notebook computer includes a hinge member and a  
3   fastener assembly. The hinge member has a seat with a lateral portion and an  
4   upright portion. A hole is defined through the upright portion, and two recesses  
5   are defined at an exterior side of the upright portion. A pintle extends through the  
6   hole. A nut is threadingly mounted at a first end of the pintle. The fastener  
7   assembly has a positioning member provided outside the pintle and between the  
8   upright portion and the nut. The positioning member has an aperture  
9   corresponding to the pintle. Two protrusions are formed at a surface facing the  
10   upright portion and engaged in the recesses in a closed status of the notebook  
11   computer. A resilient member is provided outside the pintle and between the  
12   positioning member and the nut. Whereby, the hinge has a simplified structure  
13   and a low manufacturing cost.
